~~In the article by Concha et al. 1 comparing cardiac output (CO) measurements of the FlowTrak/Vigileo monitor with those obtained by transesophageal echocardiography (TEE), the authors state that they used the transesophageal CO method previously validated by Perrino et al. 2 However, an important difference between the validated technique and that used in their study has implications with regard to the interpretation of their findings.~~

~~Echocardiography - the use of ultrasound to examine the heart- is a safe, powerful, non-invasive and painless technique. The introduction of transesophageal echocardiography (TEE) has provided a new acoustic window to the heart and mediastinum. Superior quality images of most cardiovascular structures can be obtained readily with an ultrasound probe in the esophagus.~~

~~Perioperative transesophageal echocardiography (TOE) was introduced from cardiology into cardiac anaesthesia in the 1980s. Initially TOE was used mainly as a monitor of left ventricular ischaemia, but now provides real-time dynamic information about the anatomy and physiology of the whole heart. TOE is of value in the management of patients undergoing procedures including cardiac valvular repair, surgery for endocarditis, surgery of the thoracic aorta, and may contribute useful information ...~~

~~Transesophageal echocardiography has rapidly become the most powerful monitoring technique and diagnostic tool for the management of cardiac surgical patients, primarily due to the transesophageal echocardiogram probe location and ability to be used intraoperatively. It provides the detailed information about the structure and function of the heart/great vessels in real time, allowing the cardiothoracic anesthesiologist to precisely manage patient physiology while providing updates and ...~~

~~TRANSESOPHAGEAL ECHOCARDIOGRAPHY (TEE) was first introduced as part of the anesthetic management strategy for cardiac surgical procedures in the United States in the late 1980s. 1 In 1996, the American Society of Anesthesiologists and the Society of Cardiovascular Anesthesiologists published guidelines for the perioperative use of TEE. 2 Its importance in anesthetic management and the role of the anesthesiologist in the operating room soon became clear. 3 With the use of TEE ...~~

~~Perioperative transesophageal echocardiography (TEE) is a valuable monitor for detecting myocardial ischemia, capable of rapidly and decisively guiding antiischemic therapy. Currently, the qualitative recognition of regional wall motion abnormalities (RWMAs) is the basis of the clinical use of TEE for ischemia detection.~~

~~The majority of cardiac surgical transesophageal echocardiography (TEE) imaging uses 2-dimensions, which is accomplished via phased array transducers consisting of 64 to 128 small crystals activated sequentially. 2. Pulsed-wave Doppler (PWD) profiles blood flow velocity at a single point along the ultrasound beam, whereas continuous-wave Doppler (CWD) detects the maximum velocity profile along the full length of the ultrasound beam.~~
