The progress of science has involved a series of black boxes. A mechanism other than natural selection is needed to account for rapid, large-scale changes. Gradual evolution by natural selection is essential to Darwin's theory. Darwin's gradual evolution fails to explain biological systems that are irreducibly complex.

Originally published in *Creation* 19, no 2 (March 1997): 29-30. Darwin's Black Box: The Biochemical Challenge to Evolution by Michael J. Behe is a fascinating book which deals with the question of the origin of complex biochemical systems. The author, Associate Professor of Biochemistry at Lehigh University, Pennsylvania, begins with the premise that traditional evolutionary theory does not adequately explain the complexity of basic biochemical systems.

And that kind of intellectual dishonesty has no place in science. Darwin's Black Box just confirmed my suspicions. The argument that the irreducible complexity in biochemical systems couldn't possibly have happened at random in the time that the universe has existed is rather convincing, statistically speaking.

Questioning how evolution can explain the complex chemical processes scientists are finding in humans using new technology, a unique argument for creation by either God or another higher intelligence emerges to contradict currently accepted theories. 20,000 first printing.

helped to launch the intelligent design movement: the argument that nature exhibits evidence of design, beyond Darwinian randomness. It sparked a national debate on evolution, which continues to intensify across the country. From one end of the spectrum to the other, Darwin's Black Box has established itself as the key intelligent design text -- the one argument that must be addressed in order to determine whether Darwinian evolution is sufficient to explain life as we know it. In a major new Afterword for this edition, Behe explains that the complexity discovered by microbiologists has dramatically increased since the book was first published. That complexity is a continuing challenge to Darwinism, and evolutionists have had no success at explaining it. Darwin's Black Box is more important today than ever.

The author of Darwin's Black Box draws on new findings in genetics to pose an argument for intelligent design that refutes Darwinian beliefs about evolution while offering alternative analyses of such factors as disease, random mutations, and the human struggle for survival. Reprint. 40,000 first printing.

In 1996 Darwin's Black Box thrust Lehigh University biochemist Michael Behe into the national spotlight. The book, and his subsequent two, sparked a firestorm of

criticism, and his responses appeared in everything from the New York Times to science blogs and the journal Science. His replies, along with a handful of brand-new essays, are now collected in *A Mousetrap for Darwin*. In engaging his critics, Behe extends his argument that much recent evidence, from the study of evolving microbes to mutations in dogs and polar bears, shows that blind evolution cannot build the complex machinery essential to life. Rather, evolution works principally by breaking things for short-term benefit. It can't construct anything fundamentally new. What can? Behe's money is on intelligent design.

The scientist who has been dubbed the "Father of Intelligent Design" and author of the groundbreaking book *Darwin's Black Box* contends that recent scientific discoveries further disprove Darwinism and strengthen the case for an intelligent creator. In his controversial bestseller *Darwin's Black Box*, biochemist Michael Behe challenged Darwin's theory of evolution, arguing that science itself has proven that intelligent design is a better explanation for the origin of life. In *Darwin Devolves*, Behe advances his argument, presenting new research that offers a startling reconsideration of how Darwin's mechanism works, weakening the theory's validity even more. A system of natural selection acting on random mutation, evolution can help make something look and

act differently. But evolution never creates something organically. Behe contends that Darwinism actually works by a process of devolution—damaging cells in DNA in order to create something new at the lowest biological levels. This is important, he makes clear, because it shows the Darwinian process cannot explain the creation of life itself. “A process that so easily tears down sophisticated machinery is not one which will build complex, functional systems,” he writes. In addition to disputing the methodology of Darwinism and how it conflicts with the concept of creation, Behe reveals that what makes Intelligent Design unique—and right—is that it acknowledges causation. Evolution proposes that organisms living today are descended with modification from organisms that lived in the distant past. But Intelligent Design goes a step further asking, what caused such astounding changes to take place? What is the reason or mechanism for evolution? For Behe, this is what makes Intelligent Design so important.

A leading microbiologist provides thought-provoking insights into the question of "What is Life?" as he examines the relationship of living things to the inorganic realms of physics and chemistry, explains how lifeless chemicals come together to form living beings, and details the true complexity of seemingly simple microorganisms such as *E. coli*.

Were it not for the calculus, mathematicians would have no way to describe the acceleration of a motorcycle or the effect of gravity on thrown balls and distant planets, or to prove that a man could cross a room and eventually touch the opposite wall. Just how calculus makes these things possible and in doing so finds a correspondence between real numbers and the real world is the subject of this dazzling book by a writer of extraordinary clarity and stylistic brio. Even as he initiates us into the mysteries of real numbers, functions, and limits, Berlinski explores the furthest implications of his subject, revealing how the calculus reconciles the precision of numbers with the fluidity of the changing universe. "An odd and tantalizing book by a writer who takes immense pleasure in this great mathematical tool, and tries to create it in others."--New York Times Book Review

of the origin of our universe. As mathematician, biochemist, and philosopher of science, they explore the possibility of developing a reliable method for detecting an intelligent cause and evidence for design at the origin of life. In the process, they present a strong case for opening and pursuing a fruitful exchange between science and theology. Mathematician William Dembski, author of *The Design Inference*, first argues that new developments in the information sciences make intelligent design objectively and scientifically detectable--he identifies the signs of design. Next, philosopher of science, Stephen Meyer, and biochemist Michael Behe, author of *Darwin's Black Box*, argue that these signs are now clearly evident in both the architecture of the universe and the features of living systems. Other essays by the authors defend the scientific status of the theory of intelligent design and show how that theory supports traditional religious belief without necessarily "proving" the existence of God. In a concluding essay, Michael Behe responds to critics of his best selling book, *Darwin's Black Box*, thus bringing readers up-to-date on the status of the contemporary design argument in biology.
