Learn IUPAC nomenclature by solving the following problems. To do this, start numbering from the carbon directly connected to the actual parent chain of the molecule and list the alkyl groups alphabetically:

Notice that at the end, the quasi parent chain gets the -yl suffix since it is still a substituent and the actual parent chain is placed at the end. XD.

As an introduction to the IUPAC nomenclature system, we shall first consider compounds that have no specific functional groups. Such compounds are composed only of carbon and hydrogen atoms bonded together by sigma bonds (all carbons are sp³ hybridized). Alkanes . Alkanes .
