This book provides a comprehensive, practical, and timely guide to neurorehabilitation for patients affected by tumors of the central nervous system. These patients encounter various physical and psychosocial impairments, due to sensory-motor, psychological and cognitive limitations, as well as depression, anxiety and fatigue. These common tumor and treatment consequences reduce quality of life and produce long-term limitation in functioning and disability that may benefit from rehabilitative interventions. In the early stages of the disease, rehabilitation aims at restoring functioning after tumor treatment, while in the advanced stages, rehabilitation becomes an integral part of palliative care, which aims to increase patients' independence, to prevent complications and to improve quality of life. Based on an interdisciplinary approach, the book is structured in two main parts. The first is devoted to the basics of cancer and to the main clinical features of the tumors of the nervous system, as well as to the essentials of therapeutic approaches. The second part is dedicated to rehabilitation issues, providing the tools for health personnel to take in charge persons affected by neuro-oncological disease. This unique volume is a valuable resource for all health professionals (physicians, psychologists, trainees nurses specialized in neuro-oncology, occupational therapists, physiotherapists, speech therapists) involved in the interdisciplinary management of individuals affected by tumors of the central nervous system.

Cancer imposes daunting effects on the nervous system Brain cancer is one of the most devastating diagnoses a physician can deliver. Cancer of the nervous system can take many different forms. Treatment is specific to the type of malignancy, its location in the nervous system and, increasingly, its molecular characteristics. The challenges manifest further when management choices need to be made, and multidisciplinary approaches are required. Additional complexities arise in children, where the developing neurological system requires more

sensitive treatment. Neuro-oncology unmask the complexities to provide a straightforward guide to cancers of the nervous system. Following a general approach to diagnosis and treatment, the clinical aspects of specific cancer types in adults and children are explained in practical terms. A final section considers the effect of system cancer on the nervous system and the side effects of treatment. Clinical in approach, practical in execution, Neuro-oncology will help you diagnose and manage your patients more effectively. Neurology in Practice Series Editors Robert A Gross , MD, PhD, Department of Neurology, University of Rochester Medical Center, Rochester, New York, USA Jonathan W Mink, MD, PhD, Department of Neurology, University of Rochester Medical Center, Rochester, New York, USA The Neurology in Practice series provides clinical 'in the office' or 'at the bedside' guides to effective patient care for neurologists. The tone is practical, not academic, with authors offering guidance on what might be done and what should be avoided. The books are informed by evidence-based practice and feature: Algorithms and guidelines where they are appropriate 'Tips and Tricks' boxes □ hints on improving outcomes 'Caution' warning boxes □ hints on avoiding complications 'Science Revisited' □ quick reminder of the basic science principles Summaries of key evidence and suggestions for further reading

Essentials of Clinical Radiation Oncology is a comprehensive, user-friendly clinical review that summarizes up-to-date cancer care in an easy-to-read format. Each chapter is structured for straightforward navigability and information retention beginning with a "quick-hit" summary that contains an overview of each disease, its natural history, and general treatment options. Following each "quick-hit" are high-yield summaries covering epidemiology, risk factors, anatomy, pathology, genetics, screening, clinical presentation, workup, prognostic factors, staging, treatment paradigms, and medical management for each malignancy. Each treatment paradigm section describes the current standard of care for radiation therapy including indications, dose constraints, and side effects. Chapters conclude with an evidence-based question and answer section which summarizes practice-changing data to answer key information associated with radiation treatment outcomes. Flow diagrams and tables consolidate information throughout the book that all radiation oncologists and related practitioners will find extremely useful when approaching treatment planning and clinical care. Essentials of Clinical Radiation Oncology has been designed to replicate a "house manual" created and used by residents in training and is a "one-stop" resource for practicing radiation oncologists, related practitioners, and radiation oncology residents entering the field. Key Features: Offers digestible information as a learning guide for general practice Examines essential clinical questions which are answered with evidence-based data from important clinical studies Places clinical trials and data into historical context and points out relevance in current practice Provides quick reference tables on treatment options and patient selection, workup, and prognostic factors by disease site

This second edition is designed to provide clinicians the necessary neurologic information for the diagnosis and management of these common neurologic problems. This text will be useful to all clinicians who evaluate patients who have neurologic problems. It will also be useful to medical students and residents in neurology, internal medicine, and psychiatry

□The editors...have done an outstanding job of presenting...complex information in a lucid manner □ this book is a must-read for the global community of aspiring students and neuro-oncology practitioners.□ Amar Gajjar, MD in the Foreword This is a succinct introduction to pediatric neuro-oncology. It summarizes the key advances in molecular biology that have helped transform this rapidly evolving field and

provides up-to-date coverage of major and emerging treatment modalities as well as supportive care. Separate chapters present each kind of pediatric brain cancer and its diagnosis and treatment. As more children survive brain cancer, the importance of quality of life issues and helping survivors to cope with the neuropsychological impact and long-term effects of current therapies has come into sharper focus; these topics are also addressed in the book, as are palliative care and pediatric neuro-oncology in countries with limited resources. The book is aimed at trainees and practitioners who seek an up-to-date text in pediatric neuro-oncology that is both comprehensive and concise.

Remarkable progress in neuro-oncology due to increased utilization of advanced imaging in clinical practice continues to accelerate in recent years. Refinements in magnetic resonance imaging (MRI) and computed tomography (CT) technology, and the addition of newer anatomical, functional, and metabolic imaging methods, such as MRS, fMRI, diffusion MRI, and DTI MRI have allowed brain tumor patients to be diagnosed much earlier and to be followed more carefully during treatment. With treatment approaches and the field of neuro-oncology neuroimaging changing rapidly, this second edition of the Handbook of Neuro-Oncology Neuroimaging is so relevant to those in the field, providing a single-source, comprehensive, reference handbook of the most up-to-date clinical and technical information regarding the application of neuro-imaging techniques to brain tumor and neuro-oncology patients. This new volume will have updates on all of the material from the first edition, and in addition will feature several new important chapters covering diverse topics such as advanced imaging techniques in radiation therapy, therapeutic treatment fields, response assessment in clinical trials, surgical planning of neoplastic disease of the spine, and more. It will also serve as a resource of background information to neuroimaging researchers and basic scientists with an interest in brain tumors and neuro-oncology. Provides a background to translational research and the use of brain imaging for brain tumors Contains critical discussions on the potential and limitations of neuroimaging as a translational tool for the diagnosis and treatment of brain tumor and neuro-oncology patients Presents an up-to-date reference on advanced imaging technologies, including computed tomography (CT), magnetic resonance imaging (MRI), and positron emission tomography (PET), as well as the recent refinements in these techniques
