This is an interesting and well presented book, aiming to provide a comprehensive coverage of the varied and ever expanding field of radiation pathology. The three authors are each recognised authorities in their respective fields, and their joint efforts are complemented by an interesting chapter on therapeutic applications by Dr JL Meyer.

Radiation therapy, also called radiation oncology, radiotherapy, or therapeutic radiology, the use of ionizing radiation (high-energy radiation that displaces electrons from atoms and molecules) to destroy cancer cells. linear accelerator; external beam radiation therapy

~~radiation therapy | Definition, Types, & Side Effects ...~~

Radiation therapy damages cells by destroying the genetic material that controls how cells grow and divide. While both healthy and cancerous cells are damaged by radiation therapy, the goal of radiation therapy is to destroy as few normal, healthy cells as possible. Normal cells can often repair much of the damage caused by radiation.

Radiotherapy is a type of ionising radiation (high energy) that destroys the cancer cells in the treated area by damaging the DNA of these cells. Radiation also affects normal cells. This can cause side effects in the treatment area. Usually the side effects improve a few weeks after treatment, but some might continue long term.

Radiation injury, tissue damage or changes caused by exposure to ionizing radiation—namely, gamma rays, X-rays, and such high-energy particles as neutrons, electrons, and positrons. Sources of ionizing radiation may be natural (e.g., radioactive substances such as the element radium or the radioisotopes potassium-40 and carbon-14) or man-made (X-ray machines, nuclear reactors, particle accelerators, nuclear weapons, etc.).

Radiation therapy uses high-energy rays (such as x-rays) or particles (such as photons, electrons, or protons) to kill cancer cells. When is radiation therapy used? If a tumor is very large or is on an area of the skin that makes it hard to remove with surgery, radiation therapy may be used as the main treatment.

Radiation therapy has an important role in treating all stages of breast cancer because it is so effective and relatively safe. It may be appropriate for people with stage 0 through stage III breast cancer after lumpectomy or mastectomy. Radiation can also be very helpful to people with stage IV cancer that has spread to other parts of the body.

Your skin in the radiation treatment area might look red, irritated, swollen, blistered, sunburned, or tanned. After a few weeks, your skin might become dry, flaky, or itchy, or it may peel. This is sometimes called radiation dermatitis. It's important to let your cancer care team know about any skin changes.

~~Radiation Therapy Side Effects — American Cancer Society~~

Radiation dermatitis is a side effect of external beam ionizing radiation. It is also called radiodermatitis, x-ray dermatitis, radiation skin damage or a radiation burn. Most commonly, radiation-induced dermatitis is caused by radiotherapy for underlying malignancies.
